

## **New Energy Technologies (NENE) JULY 2009**

New Energy Tech., is an Alternative Renewable Fuels Company. It has strong R&D. The Company is in the process of developing unique ways to harness the Solar Power that could be generate efficiently and cost effectively. The company has developed a simple system for Homes and Offices. Instead of costly and bulky installations it has developed a ultra-thin solar cells for transparent SolarWindows™

However, the promising breakthrough is taking place in it's Kinetic Energy Division. The Company has developed this unique technology, Capturing Energy from moving Vehicles! the idea seems pretty simple and practical. The company recently announced that it has installed and testing the new equipment at a Burger King restaurant in New Jersey.

If the commercial experience proves that it could generate enough electricity to justify the investment, this could be a biggest breakthrough for the company and the possibility of Country wide deployment would put this company in a unique position. Since it has pioneered this technology, it would have first movers advantage.

This technology has several advantages, including easy installation and operation, and can be installed at any location without costly modifications to the road surface, according to the company.

If it is commercially viable, as the company says it is, then the funding would not be a major hurdle. There are plenty of Federal Funds and the Venture Capital is sitting on the side lines waiting for opportunities. We would love to see the independent analysis from their BK installation. This company is on our radar and we think it is worth watching closely.
